

Case Analytics

Medical Litigation Support Services

Case Analytics provides a full spectrum of litigation support products and services designed to assist the attorney in cases involving some medical aspect. These products and services are structured on a continuum of increasing complexity, detail, and analysis. The attorney can then select from this menu those products/services that will optimally address the precise litigation support needs of each individual case.

- **Case Analytics' Medical Record Acquisition** service relieves the law firm of the challenge locating the many health care providers typically referenced in a given case. Case Analytics will obtain the necessary medical records from these providers and coordinate payments to each provider for the duplication and delivery of these records.
- **Case Analytics' Medical Record Organization** service brings order to the volumes of records frequently encountered in medical litigation. Imaging and indexing capabilities enable Case Analytics to provide medical records to law firms in an electronic format compatible with the firm's own software.
- **Case Analytics' Medical and Scientific Literature Research** provides an expert review of the relevant published and unpublished literature relating to a given case and then distills this information into a knowledge-based summary or case manual.
- **Case Analytics' Medical Case Abstracts** are helpful for the attorney attempting to understand the medical characteristics of plaintiffs in a collective or single action. A Medical Case Abstract is a one-to-two page overview of each plaintiff's medical records. The abstract has particular utility for law firms selecting the most viable bellwether claimants from among hundreds of plaintiffs in a given mass tort.
- **Case Analytics' Medical Case Chronologies** are objective timelines of all or selected medical encounters experienced by the plaintiff. These fact-based work products translate hundreds of pages of medical records into a succinct summary illuminating the salient medical findings of the case.
- **Case Analytics' Medical Case Analyses** take the Medical Chronology and add the component of analysis designed to explain the case's medical components in language understandable by the non-physician. The Medical Case Analysis also incorporates findings from medical literature research and can suggest alternate causation for the plaintiff's medical condition.
- **Case Analytics' Medical Billing Analyses** delineate the extent of all remaining medical expenses borne by a plaintiff subsequent to coverage by third party payers.
- **Case Analytics' Customized Products** are developed in partnership with the attorney to satisfy the specialized requirements of new or unique litigation. For example, custom made litigation support products can range in nature from an epidemiologic and demographic analysis of thousands of plaintiffs represented in a class action to a standards-based critique of hundreds of pulmonary function test reports cited in industrial exposure litigation. Case Analytics can also identify additional, but critical, healthcare providers involved in a case but whose participation and medical records were not disclosed during initial discovery.
